

System 701579900

Advantage over original system:

## Generator/electronic ignition for Pannonia 1 Zylinder

- with original magnet based system

- Magnet based generator with integrated fully electronical ignition. Output at 12V/100W DC. Solid state ignition with own power supply from within the system. Replaces old dynamo, points, ignition coils. No changes on engine casing needed. The system is technically capable of running without battery.

- For Pannonia with original dynamo system see 701479900.

all parts are new

.

•

- more light output
- very stable ignition with solid spark
- better starting, better fuel burning
- no wear anymore on points

Assembly instructions for system 701579900	29.11.2022	
<ul> <li>If you can install and time a stock ignition and possess basic mechanical install a VAPE! If you never have worked on your ignition, better have it do who knows.</li> </ul>	one by someone	
<ul> <li>VAPE can not monitor the compliance to those instructions, nor the conditions installation, operation, usage and maintenance of the system. Improper installati damage to property and possibly even bodily injury. Therefore we assume no re damage or cost which result from, or are in any way related to, incorrect installat operation, or incorrect use and maintenance. We reserve the right to make chan technical data or assembly and operating instructions without prior notice</li> </ul>	ion may result in sponsibility for loss, tion, improper	
<u>IMPORTANT</u>		
- Please read these instructions fully and carefully before starting work on Please bear in mind that any modification of the material as well as own repair a not been agreed with VAPE may result in a loss of warranty. Do not cut off wires loss of reverse polarity protection and often results in damage to electronics. Als of the information provided on the information page for this system. Check that w bought really corresponds to the motorcycle you have. Wrong ignition settings m engine and even hurt you during kickstart (violent kickbacks). Be careful during to needed change settings to safer values (less advance). During assembly check rotor (flywheel) does not touch the stator coils or anything else, which may happ circumstances and lead to severe damage.	ttempts which have s. This leads to a so, please take note what you have hay damage your the first test runs. If carefully that the	
<ul> <li>Designated use</li> <li>This system is designated to replace stock dynamo/alternator &amp; ignition system classic motorcycles whose engine characteristics have not been modified at system is not a tuning system and it will not bring significant increases in engine however significantly enhance roadworthiness and comfort by offering better light of side indicators and horn and, compared with the aging stock systems, increase our system does not tamper with engine characteristics it does not increase emispollutants and noise. In most cases emission of pollutants should even be reduct combustion. If used as designated the system therefore will not normally infringer status of the motorcycle. (Please check your local legal regulations!) This system use in competition events. If used other than the designated way, your warranty it might well be that you do not obtain the desired results or, worst you loose legal</li> </ul>	ftermarket. This output. It does nting, better function sed reliability. As ssion of gaseous ed due to better the existing legal n is not suitable for will be voided and al roadworthiness.	
- VAPE guarantees homologated products marked with the "E" mark in the ring (E8 specifically for the Czech Republic), thereby ensuring a consistent conformity of the product properties with the relevant ECE homologation regulations (especially ECE R10.05). Inspection is regularly carried out by the competent authority.		
- The charging system is only suitable for use with rechargable 12V (6V system is only suitable for use with rechargable 12V (6V system) acid batteries with liquide electrolyte or sealed lead-acid batteries, AGM, Gel. It use with nickel-cadmium, nickel-metal-hydride, lithium-ion or any other types of rechargable batteries.	t is not suitable for recharchable or non	
- This is a <b>replacement system and not a copy of the stock material</b> . The pa therefore look different and might fit differently (notably ignition coil and regulator adaptation by you.	2	
- During assembly imperatively start with assy of engine based parts to see before you start fitting the external parts. In many cases customers assemble the thereby often modify them in breach of warranty which renders them unfit for ren Replacing old ignition systems is not a matter of taking something from a supern there have been very many types, versions and possibly unknown aftermarket m harbour plenty of room for error.	ose first and newed sale. narket shelf as	
- Our systems are <b>NOT tested for use with third party electronic devices (su mobile phones, LED lighting etc) and may cause damage to such parts.</b> Por electronic tachometers will not work with the new system. Possibly existing safet electronic valve controls are not supported. It might be that your motorcycle was with an ignition that did limit top speed for legal reasons. The new system does not facility, so check your legal situation beforehand.	ossibly existing ty switches and s originally equipped	

- If you have no expertise for the installation have it done by an expert or at a specialist's workshop. Improper installation may damage the new system and your motorcycle, possibly even lead to bodily harm.

- Before you order a system, please check whether a puller tool for the new rotor is included in the kit. If not, better order it at the same time. Never use anything other than the recommended puller tool to pull the new rotor again. Damage to the rotor as a result of use of other tools or methods is not covered by your warranty.

- The rotor is sensible to blows (including during transport). Before assembly, please always check for damage (on rotor without magnet plastification try to push the magnets aside with your fingers). After impact the glued in magnets might have broken loose, sticking to the rotor solely by magnetic force, so that one does not notice right away. During engine run the damage would be considerable. Before placing the rotor onto the engine, please make sure that its magnets have not collected any metal objects such as small screws, nuts and washers. That equally would lead to severe damage.

- If you have access to the Internet, best view those instructions online. You get larger and better pictures by clicking onto them and possibly updated information. System list at *http://www.powerdynamo.biz* 

## You should have received those parts:

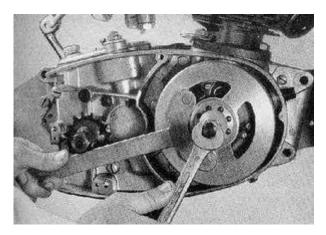

- stator unit (preassembled)
- rotor / mounting nut
- regulator/rectifier
- ignition coil and high tension cable
- cables: red, brown, blue
- cable binders
- 3 screws M5x20
- 1 washer

- To disengage your new rotor again, you will need a puller M27x1.25 (part-no.: 99 99 799 00 **-Not provided!-**).

- Note: Never use a claw puller, a hammer or any other device, that will shake the magnets off.

- Make sure your motorcycle rests securely, preferably on an elevated work bench and that you have good access to the magneto side of the engine.

- Disconnect all wires to the old dynamo and take those parts off.

- Take the woodruff key from the crank pin. It will not be needed any more and prevent assembly. If you forget this right at start, you will have to take the whole new unit off again to get access to the key.

- Take a look at the new stator unit. You will find at the adapter plate, left of the black coil, an ignition marking.

- Don't remove the stator off the ground plate, it's needlessly and you're only in risk to damage the coils and the cables below.

- Put the preassembled stator unit onto the motor case. The thick black coil shows at 7 o'clock. Screw down the unit with the 3 screws M5.

<u>- Attention:</u> There is no reason to remove the stator from its mounting plate. But if you do remove it, please insure that it reinstalled correctly. Since the ignition timing would be 120° off if the stator were installed incorrectly. Put the stator coil back onto the plate, take care not the damage the wires. The stator has to snap in rather sharply. If it sets soft, you have probably squeezed a wire underneath!

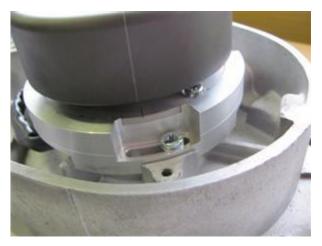

- Make sure that the inner opening of the stator unit slots evenly over the elevated fixing rim of the base plate - otherwise the coil will sit lopsided and will touch the rotor, damaging it.

- Press the rubber grommet which is on the stator wire into the engine casing and cut the surplus material off as shown here

- Take the spark plug out and bring the piston into ignition position (put the rotor loosely onto the crank shaft and using it as a turning knob).

- Then remove the rotor from the shaft and put the rotor carefully back on the crank shaft (without changing its ignition position) in such a way, that the marking on the rotor align with the marking on the adapter plate.

- It is very important during that procedure, not to alter the crank's ignition position, otherwise you have to redo all.

- Fasten the rotor with the supplied nut, place the 2 washers 18x25x1 under the nut (Important!).
- To disengage your new rotor again, you will need a puller M27x1,25 (part 99 99 799 00).
- With that work at the motor finished. Screw in the spark plug again.

## Connect the parts as shown in wiring diagram 71ik\_102:

- To facilitate wire exit through the often small openings in the engine casing, the plastic plug of the generator's wiring that leads to the ignition coil have not been put onto the wire terminal. You should place the plug there only once all has been properly installed on the engine side.

- Look for the ignition coil with its female plug and the two wires (red and white).

- Put the provided 2-position plug housing onto this plug and insert the two wires (red and white) from the generator. Make sure that the terminals engage securely in the housing and that you connect:

- white to white
- red to red

- Should you need (or want) to get the terminals out of the plug housing again, enter a paper clip from front next to the terminals and push the little barb aside. Than pull the wire out.

- The brown wire from the new generator with the round eye terminal has to be screwed directly to the holder frame of the ignition coil (ground).

<u>Take note! disrespecting is the most frequent cause for ignition problems!</u> Without this <u>direct</u> connection the system does not work or not work for long without problems. Please do not rely on the frame for ground. Paint, oil and dirt often prevent good contact!

brown = minus	The new regulator/rectifier has 4 wires	
Regulator 7300	<ul> <li>2 black ending in a plastic plug for the AC input from the 2 black generator wires</li> <li>1 red with a plastic plug which outputs plus</li> <li>1 brown with a plastic plug beeing ground (minus)</li> </ul>	
- The two black cables leading from the	should be first introduced into the supplied	
generator	twin plastic plug housing. This housing connects to the plastic plug at the end of the 2 black wires on the regulator. It does not matter which black is at which side, as there is AC.	
- The brown cable from the regulator	should connect to either battery minus or	
- The red cable from the regulator	good ground if there is no battery. should connect to either battery <b>12V PLUS</b> or	
Take care: Wrong polarity will damage the electronic	if there is no battery to the wiring that runs to your consumers (normally main switch intake	
Make sure that you have a <b>15<i>A-fuse</i></b> between battery and vehicle circuitry.		
<ul> <li>There is NO facility for a charge control light without battery this will not work anyway. The regulator has an inbuilt high potency condenser to smoothen voltage. This will make sure that your side indicators (flashers) and horn will work correctly even without battery.</li> <li>Remains the blue (sometimes blue/white) wire at the ignition coil. This is the kill (cut-off) wire.</li> <li>Connected to ground - it will stop ignition!</li> <li>This type of wiring is used in motorcycles which evicine and therefore.</li> </ul>		
<u>Note:</u>	originally already had magneto ignition and therefore switched off by shortcircuiting against ground.	
- Should you experience ignition failures, disconnect as a first measure this blue wire. In many cases that will permit you to get mobile again	- Those vehicles have by design a main lock (or some kill switch) that connects a pin to ground when in OFF position (German bikes: pin 2). The blue(/white) wire of the ignition coil will be connected here. In that way the cut-off works like previously.	
Screw the high tension (ignition) cable	into the ignition coil and pull over the rubber seal before mounting the coil (it will be easier).	
- Please <b>do not use</b> any spark amplifying cables, such as "Nology supercables" or "hot wire". This will disturb the system and possibly damage it.	<ul> <li>Please do use the cable arriving with the pack and not any old cable.</li> </ul>	
<ul> <li>You will do yourself a favour to treat your bike to new spark plugs and spark plug sockets (preferably some between 0-2kOhm). Plenty of problems are to be traced back to "apparently good" (even completely "brand-new") sparks plugs, terminals and cables.</li> <li><u>Do not use</u> spark plugs with an intern suppression resistor. NGK (e.g.) offered such spark plugs coded with an "R" (for resistor).</li> </ul>		
- Finally - <b>and before installing the battery and before the first kickstart</b> - please re-check carefully all connections and fitments against the wiring diagram. Do check battery and light bulbs for correct voltage (12V).		
<ul> <li>Should something not work, please consult our trouble-shooting guide on our homepage. As a first step disconnect the blue wire from the coil and re-test.</li> <li>IMPORTANT: During crank shaft repair the dynamo shaft is often machined and gets shorter.</li> </ul>		
The result is a rotor sitting lower, possibly touching now with its rivets the stator coil. The result is a destroyed stator and ignition failure.		

**E**8

- When you handle the new rotor, take care not to damage its magnets. Refrain from direct blows to the circumference of the rotor. When transporting never put the rotor over the stator. Observe our information relative to transport of the material.

- Do not use spark plug sockets with a resistance of more than 5kOhm. Better use 1 or 2kOhm ones. Bear in mind that spark plug sockets do age and thereby increase their internal resistance. Should an engine start up only when cold, a defective spark plug socket and/or spark plug is very probably the cause. In case of problems check high tension cables too. Never use carbon fibre HT-cables, never use so called "hot wires" which promise to increase spark.

- It is a good idea to cover the rotor in a thin layer of oil to reduce the risk of corrosion.

- Never use a claw puller or a hammer to disengage the rotor. Its magnets might become loose in the event. We offer a special puller for disengaging the new rotor again (see assembly instruction)!

- Should the motorcycle not be in use for some longer period, please disconnect the battery (so existing) to prevent current bleeding through the diodes of the regulator. Though, even a disconnected battery will empty itself after a while.

- Please do observe these remarks, but at the same time, don't be afraid of the installation process. Remember, that before you, thousands of other customers have successfully installed the system. *Enjoy driving your bike with its new electric heart!*
