

System 1306799IWL**Advantage over original system****6 volts generator/electronic ignition for IWL Scooter (for Pitty, Berlin, Wiesel, Troll)**
- For 12 volts see system 13 21 799 IWL

- Magnet based generator with integrated fully electronic ignition. Output 12V/75W AC. Solid state ignition with own power supply from within the system. Replaces old dynamo, points, condenser, ignition coils. You may drive without a battery, if you want, you will have to install in that case however a large capacity condenser. There is no need for changes on engine casing.

- all parts are new
- more light output
- very stable ignition with solid spark
- better starting, better fuel burning
- no huzzle anymore with setting points

Assembly instructions for system 1306799IWL	7.11.2022
<p>- If you can install and time a stock ignition and possess basic mechanical skills, you can install a VAPE! If you never have worked on your ignition, better have it done by someone who knows.</p>	
<p>- VAPE can not monitor the compliance to those instructions, nor the conditions and methods of installation, operation, usage and maintenance of the system. Improper installation may result in damage to property and possibly even bodily injury. Therefore we assume no responsibility for loss, damage or cost which result from, or are in any way related to, incorrect installation, improper operation, or incorrect use and maintenance. We reserve the right to make changes to the product, technical data or assembly and operating instructions without prior notice</p>	
<p><u>IMPORTANT</u></p>	
<p>- Please read these instructions fully and carefully before starting work on your motorcycle Please bear in mind that any modification of the material as well as own repair attempts which have not been agreed with VAPE may result in a loss of warranty. Do not cut off wires. This leads to a loss of reverse polarity protection and often results in damage to electronics. Also, please take note of the information provided on the information page for this system. Check that what you have bought really corresponds to the motorcycle you have. Wrong ignition settings may damage your engine and even hurt you during kickstart (violent kickbacks). Be careful during the first test runs. If needed change settings to safer values (less advance). During assembly check carefully that the rotor (flywheel) does not touch the stator coils or anything else, which may happen due to various circumstances and lead to severe damage.</p>	
<p>Designated use - This system is designated to replace stock dynamo/alternator & ignition systems in vintage and classic motorcycles whose engine characteristics have not been modified aftermarket. This system is not a tuning system and it will not bring significant increases in engine output. It does however significantly enhance roadworthiness and comfort by offering better lighting, better function of side indicators and horn and, compared with the aging stock systems, increased reliability. As our system does not tamper with engine characteristics it does not increase emission of gaseous pollutants and noise. In most cases emission of pollutants should even be reduced due to better combustion. If used as designated the system therefore will not normally infringe the existing legal status of the motorcycle. (Please check your local legal regulations!) This system is not suitable for use in competition events. If used other than the designated way, your warranty will be voided and it might well be that you do not obtain the desired results or, worst you loose legal roadworthiness.</p>	
<p> - VAPE guarantees homologated products marked with the “E” mark in the ring (E8 specifically for the Czech Republic), thereby ensuring a consistent conformity of the product properties with the relevant ECE homologation regulations (especially ECE R10.05). Inspection is regularly carried out by the competent authority.</p>	
<p>- The charging system is only suitable for use with rechargeable 12V (6V systems 6V) lead-acid batteries with liquide electrolyte or sealed lead-acid batteries, AGM, Gel. It is not suitable for use with nickel-cadmium, nickel-metal-hydride, lithium-ion or any other types of rechargeable or non rechargeable batteries.</p>	
<p>- This is a replacement system and not a copy of the stock material. The parts in this system therefore look different and might fit differently (notably ignition coil and regulator) requiring some adaptation by you.</p>	
<p>- During assembly imperatively start with assy of engine based parts to see that those really fit before you start fitting the external parts. In many cases customers assemble those first and thereby often modify them in breach of warranty which renders them unfit for renewed sale. Replacing old ignition systems is not a matter of taking something from a supermarket shelf as there have been very many types, versions and possibly unknown aftermarket modifications which harbour plenty of room for error.</p>	
<p>- Our systems are NOT tested for use with third party electronic devices (such as GPS, mobile phones, LED lighting etc) and may cause damage to such parts. Possibly existing electronic tachometers will not work with the new system. Possibly existing safety switches and electronic valve controls are not supported. It might be that your motorcycle was originally equipped with an ignition that did limit top speed for legal reasons. The new system does not have such a facility, so check your legal situation beforehand.</p>	

- If you have no expertise for the installation have it done by an expert or at a specialist's workshop. Improper installation may damage the new system and your motorcycle, possibly even lead to bodily harm.

- Before you order a system, please check whether a puller tool for the new rotor is included in the kit. If not, better order it at the same time. Never use anything other than the recommended puller tool to pull the new rotor again. Damage to the rotor as a result of use of other tools or methods is not covered by your warranty.

- The rotor is sensible to blows (including during transport). Before assembly, please always check for damage (on rotor without magnet plastification try to push the magnets aside with your fingers). After impact the glued in magnets might have broken loose, sticking to the rotor solely by magnetic force, so that one does not notice right away. During engine run the damage would be considerable. Before placing the rotor onto the engine, please make sure that its magnets have not collected any metal objects such as small screws, nuts and washers. That equally would lead to severe damage.

- **If you have access to the Internet, best view those instructions online.** You get larger and better pictures by clicking onto them and possibly updated information. System list at <http://www.powerdynamo.biz>

- **You should have received those parts!**

Please pay attention:

- The stator and the sensor are not screwed tight on the base plate.
- You have to remove the stator for mounting the base plate on the crank case. And the sensor has to be adjusted by yourself. Tighten the screws after that well.

- To disengage your new rotor again, you will need a puller M27x1,25 (part-no.: 99 99 799 00 **-Not provided!**).

- **Note:** Never use a claw puller, a hammer or any other device, that will shake the magnets off.

- To disengage your old rotor, you will need a puller screw M10x90 (part-no.: 89 99 026 00 - **Not provided!**).

- **Notes on wiring:**

Experience shows that in the course of time nearly every motorcycle undergoes changes to its wiring. As a result, wire colours and wires themselves on your bike might differ to those we describe. In case of doubt, please consult the original wiring diagrams for MZ (e.g. on www.ostmotorrad.de).

- Make sure your IWL rests securely on her stand, preferably on an elevated work bench and that you have good access to the generator side of the engine. You will have to move the direction of the front fork for better handling at the generator.
- You have to decide which method of ignition cut-off you will use. There are different ways. We have pre-assembled the relay option.

- Relay option (delivered as standard)

pro: You may use the ignition lock as previously. There are no changes on the handling of your bike.

contra: You can't use the new system without the battery (but in a case of emergency you can drive without, only the ignition cut-off is out of work).

- Position 5 method

pro: The bike will be totally driven without battery. This is a big **PRO** for oldtimer, they will be seldomly driven.

contra: You can't cut-off the ignition with the ON/OFF position of the ignition lock, you have to switch the lock short-time on position 5 (previous bump-start position). Further, the bike may be kick-started without ignition key.

- Cut-off switch method

pro: The bike will be totally driven without battery. There is no relay, that might fail.

contra: You have to install an additional cut-off switch, preferably at the handle-bars.

Tip: You can convert the flasher button as the cut-off (kill) switch.

Tip no. 1: When you make use of the non-battery options and have side indicators (flashers) at the same time, you will need to install a high capacity condenser (22.000 μ F) in place of the battery to smoothen the pulsing voltage. Otherwise your flasher unit will go heywire.

- Disconnect the cables from your old generator, regulator and ignition coil.

- That's normally:

- cable DF (green/blue)
- cable D+ (green/red)
- the (green) cable to the ignition coil
- the (brown) ground cable

- Then remove the generator with the rotor, the regulator and the ignition coils.

- If there is an arresting pin in the motor case, remove it with a plier or cut it off. Otherwise the generator won't fit in the case.

- Remove the 3 fixing screws which hold the stator coil to its base. Now you can lift-off the coil a little away (ca. 1cm) from the ground plate. So as the mounting holes on the ground plate become accessible.

- Take care not to damage the paint insulation!

- You have to identify the mounting holes, which were the right ones for your IWL-version. For **Pitty, Wiesel, Berlin** and **Troll1** you need the ignition point **4 mm BTDC** (marked blue in the picture).

- The second mounting hole pair is for the later MZ-engines (e.g. **MZ/ES**). For that will be needed an ignition point at **2.8 mm BTDC**.

- **Take care** of the stator cable. It has to lead through the "Kabel" opening. Otherwise the point of ignition is wrong and the engine won't work.

- The photo shows how the outer steel ring has to be positioned on the old generator.

- Mount the new stator plate (steel- & aluminium ring), using the original mounting holes, on the crank case (like shown here).
- Note especially to use the correct mounting holes of the plate (see above).
- The stator coil hangs loosely on the cable.

- Once the plate is fixed, reset the stator coil onto it. Here make double sure not to pinch any wires underneath. At the end, the coil will sort of snap in sharply, even with some noticeable click. If it sits down rather softly, that you can bet there is a wire underneath. Take care that the coil sits even on the ground plate, otherwise the unit will be damaged or at least it causes dysfunctions.

- Scrutinize for the last time the mounting holes of the stator: take care to use the right ones for your engine (see above).

- Screw down the coil with the 3 hex screws M4x25.

- Under no circumstances effect mechanical changes on your engine casing in order to fit the system (save for pulling or breaking the pin at the stator base). Do not try to assemble the new stator without the steel ring, even if you think temporarily that fitment may only be achieved that way.

- The steel adapter of the system will come to sit at the upper recess for the dynamo, as shown here in the picture (and not somewhere further down the engine as you might initially tend to think).

- Pay attention at the register pin of the crank shaft, you will need it for the ignition adjustment. Please check, if the rotor is positioned on the register pin. Sometimes the pin is too large and the rotor don't fits. Than you have to shorten the pin with a file.

- Put the rotor on the crank shaft. Take care that he arrested at the register pin.
- Check also, that the rotor runs freely above the base plate.
- Screw down the rotor with the screw M7x40. Don't forget to use the washer.
- To pull the new rotor again, you will need a puller tool M27x1,25.

- Have a look at the new rotor. You will find on its circumference a small pressed in line. That is an ignition marking. It is durable, but not well visible, so better highlighten it with some marker pen.

- You will find on the aluminium ground plate a second marking (in the picture white encircled).

- Both markings have to align - than sparks will fly.

- But, of course, the system has to be ready for use.

- The ignition point of our systems is optimally pre-advanced. But if you like to check it, you will find on our "measurement with the stroboscope"-page more informations.

- How to set timing?

- Have a look at the new rotor. You will find at its circumference a small laserd in line. This is some ignition marking.

- Fasten the regulator/rectifier and the relay on a convenient place, for the IWL you will find different solutions. Here are some proposals from our customers.

- **Take note:** Don't position the parts on places with great heat radiation! It's not easy, but possible!

SR 59 Berlin

SR 59 Berlin

SR 59 Berlin

Troll 1

Pitty

harness: batterie + fuses

- You should modify the ground plate of the old regulator as a holding plate for the new one.

The following steps will depend on switch-off method chosen.

In all cases, you will have to open the headlamp housing and identify pin 61 at the main switch.

- If you use the relay option, you don't have to open the dashboard underneath the handlebars. There are nothing to switch.

If you use the position 5 option, you have to modify the ignition lock (described in the ES/TS assembly instruction).

Relay and kill-switch method

- Disconnect the 2 blue wires from pin 61 of your ignition lock. Do not cut the connection between the 2 wires (in case they had been sitting on individual terminal pins, connect them now using a piggy back terminal). Insulate the wire terminals, so that they can not accidentally connect to ground or other terminals. Pin 61 will remain empty.

Position 5 method

- Disconnect the one blue wire from pin 61 of your ignition lock that runs to the charge control light. This light will not function with the new system and anyway without battery and only in that case you have to resort to things as position 5 method. If the 2 blue wires at pin 61 are connected in one terminal, you have to cut this wire. The other blue wire running down to the regulator will be used further on. It has to remain connected to pin 61 of the switch.

- After you have taken the old regulator off, you have the following wires to deal with

- several brown ground wires which will be connected again to ground with the new regulator
- a blue wire (previous on pin 61) which will be connected to the red/green single wire at the new regulator
- a green/red wire (previous on pin D+) and a green/blue wire (previous on pin DF) which will be eliminated right down to the seat of the dynamo
- a red/green wire (previous from Pin 51 to the fuse) will be eliminated.

Please note: All our 6 Volt systems do not support the charge control function!

Connect the parts as shown in wiring diagram 71ir6:

- To facilitate wire exit through the often small openings in the engine casing, the plastic plug of the generator's wiring that leads to the ignition coil have not been put onto the wire terminal. You should place the plug there only once all has been properly installed on the engine side.

- Look for the ignition coil with its female plug and the two wires (red and white).
- Put the provided 2-position plug housing onto this plug and insert the two wires (red and white) from the generator. Make sure that the terminals engage securely in the housing and that you connect:
 - white to white
 - red to red

- Should you need (or want) to get the terminals out of the plug housing again, enter a paper clip from front next to the terminals and push the little barb aside. Than pull the wire out.

- The brown wire from the new generator with the round eye terminal has to be screwed directly to the holder frame of the ignition coil (ground).

Take note! disrespecting is the most frequent cause for ignition problems !! Without this direct connection the system does not work or not work for long without problems. Please do not rely on the frame for ground. Paint, oil and dirt often prevent good contact!

- The regulator/rectifier has a compact plug with 6 positions, of which two are not used. A female plug cover fitting to this plug is delivered. Into this female plug you have to insert the following wires (which have terminals that snap into the plug):

The two black cables leading from the generator ...

... connect to pins 1/4 of the new regulator (from there equally black wires lead inside the unit). It does not matter which wire connects to which of the both terminals (1/4) as they carry alternating current.

The new brown cable with the round eye terminal ...

... connects pin 3 of the regulator unit (from there a white wire goes inside the unit) with the negative pole of the battery or (in case you drive without battery) to ground (chassis).

<p>The new red cable with the round eye terminal ...</p>	<p>... connects to pin 5 of the new regulator (from there equally a red wire goes inside the unit). Here your regulated positive voltage comes out to connect to battery plus, or (in case you drive without battery) to the voltage input terminal of the main switch (ignition lock, German bikes: pin 51/30).</p>
<p>- Make sure that you have a 15A-fuse between battery and vehicle circuitry.</p>	
<p>- The 6 Volt regulator has NO provision for a charge control light!</p>	

<p>Remains the blue (sometimes blue/white) wire at the ignition coil. This is the kill (cut-off) wire.</p> <p>Connected to ground - it will stop ignition!</p> <p>Note: Should you experience ignition failures, disconnect as a first measure this blue wire. In many cases that will permit you to get mobile again</p>	<p>- Switch off via separate kill switch (when driving without battery): The relay will not be fitted. The blue(/white) cable of the ignition coil will be connected to a kill switch, closing against ground (a button at the handlebars). Or you mount an ignition lock that has a facility to connect against ground when in OFF position.</p> <p>- Battery method: Connect the brown relay wire to good ground. Lead the longer black wire from the relay to the wire that did run previously to a pin carrying voltage when the switch is on (in German bikes: pin 15) and connect it there. Connect the blue wire from pin 30 of the relay to the blue(/white) wire at the new ignition coil. should your battery fail on the road, just disconnect that blue wire and your bike will run again (it will now only not stop by switching off).</p>
---	---

<p>Relay wiring (if used):</p> 	<p>- The brown wire with the ring terminal from pins 87a und 86 goes to ground.</p> <p>- The black wire from pin 85 goes to a main switch terminal carrying voltage if switched on.</p>
<p>Screw the high tension (ignition) cable ...</p> <p>- Please do not use any spark amplifying cables, such as "Nology supercables" or "hot wire". This will disturb the system and possibly damage it.</p>	<p>... into the ignition coil and pull over the rubber seal before mounting the coil (it will be easier).</p> <p>- Please do use the cable arriving with the pack and not any old cable.</p>
<p>- You will do yourself a favour to treat your bike to new spark plugs and spark plug sockets (preferably some between 0-2kOhm). Plenty of problems are to be traced back to "apparently good" (even completely "brand-new") sparks plugs, terminals and cables. - Do not use spark plugs with an intern suppression resistor. NGK (e.g.) offered such spark plugs coded with an "R" (for resistor).</p>	

- Finally - **and before installing the battery and before the first kickstart** - please re-check carefully all connections and fitments against the wiring diagram. Do check battery and light bulbs for correct voltage (12V).

- Should something not work, please consult our trouble-shooting guide on our homepage. As a first step disconnect the blue wire from the coil and re-test.

- IMPORTANT: During **crank shaft repair** the dynamo shaft is often machined and gets shorter. The result is a rotor sitting lower, possibly touching now with its rivets the stator coil. The result is a destroyed stator and ignition failure.

Important safety and operating information

- Safety first! Please observe the general health and safety regulations motor vehicle repair (MVR) as well as the safety information and obligations indicated by the manufacturer of your motorcycle. The timing marks on the material are for general guidance only during first installation. Please check after assembly by suitable means (stroboscope) that settings are correct to prevent damage to the engine or possibly even your health. You alone are responsible for the installation and the correctness of settings.

- Ignition systems generate high tension! With our material right up to 40,000 Volts! This may, if handled carelessly, not only be painful, but outrightly dangerous. Please do keep a safe distance to the electrode of your spark plug and open high tension cables. Should you need to test spark firing, hold the spark plug socket securely with some well insulating material and push it firmly to solid ground of the engine block. Never pull sparkplug caps when engine is running. Wash your vehicle only with engine at standstill and ignition off.

- You should have received the HT Cable with the fixed rubber cap (*which does not contain a resistor*) as a part of the kit, you should have to use a spark plug with an inbuilt resistor (*or replace the cap with the one containing a resistor*) to comply with your local laws (*Electromagnetic compatibility requirements*).

- Do not use a spark plug cap(s) containing a resistor **WITH** a spark plug(s) containing a resistor at the same time. It would cause problems, especially difficult engine starting. The total resistance of cap and spark plug combined should not exceed 5kOhm.

- Remember that candle plugs age, increasing resistance. If an engine only starts when it is cold, it is very likely that a defective spark plug connector or faulty spark plug is the cause. Do not use so-called ignition-reinforcing cables (e.g. Nology).

- After installation, please check tightness of all screws, even those preinstalled. If parts get loose during run, there will be inevitably damage to the material. We pre-assemble screws only loosely.

- Give the newly installed system a chance to work, before you start to check and test values, or what is worse apply changes to it.

Our parts have been checked before delivery to you. You will not be able to check much anyway. **At any rate do refrain from measuring the electronic components (such as ignition coil, regulator and advance unit). You risk severe damage to the inner electronics there. You will not get any tangible results from the operation anyway.** Bear in mind that also your carburetor, your spark plugs and spark plug sockets (even if completely new) might be the reason for malfunction. The general experience with our systems is that the carburetor will have to be re-adjusted to lower settings. Should the system not start after assembly, first disconnect the blue (or blue/white) cut-off wire directly at the ignition coil (or in some cases advance unit) to eliminate any malfunction in the cut-off circuitry. Check ground connections carefully, make sure there is a good electrical connection between frame and engine block. In case of troubles, please consult our Knowledge Base first before you send off the material to us for checking.

- The spark of classic, points based ignition systems has with about 10,000 Volts comparatively little energy and looks therefore yellow and fat (which however makes it highly visible). The spark from our system is a high energy spark with up to 40,000 Volts and therefore is needle thin focused in form, and blue in colour, which makes it not so visible. Furthermore you get spark only at kick-start operated speeds and not by pushing the kick-lever down slowly with your hand (as you might get with battery based ignitions).

- Systems using a twin outlet ignition coils have a few peculiarities. Please observe that during tests on one side, the other has either to be connected to an fitted spark plug or securely

earthed/grounded. Otherwise there will be no spark on either side. Also with such open exits long and dangerous sparks may fly all over the coil.

- Never do electric arc welding on the bike without completely disconnecting all parts containing semiconductors (ignition coil, regulator, advance) stator and rotor need not be taken off. The same is true for soldering. Before touching electronics disconnect the soldering iron from mains! Never use copper putty on spark plugs.

- Electronics are very sensitive to wrong polarity. After work on the system, do check correct polarity of the battery and the regulator. Wrong polarity creates short circuits and will destroy the regulator, the ignition coil and the advance unit. As a rule, wiring will always be colour to colour. Instances, where colour jumps between wires are expressly mentioned in our instructions.

- When you handle the new rotor, take care not to damage its magnets. Refrain from direct blows to the circumference of the rotor. **When transporting never put the rotor over the stator.** Observe our information relative to transport of the material.

- Do not use spark plug sockets with a resistance of more than 5kOhm. Better use 1 or 2kOhm ones. Bear in mind that spark plug sockets do age and thereby increase their internal resistance. Should an engine start up only when cold, a defective spark plug socket and/or spark plug is very probably the cause. In case of problems check high tension cables too. Never use carbon fibre HT-cables, never use so called "hot wires" which promise to increase spark.

- It is a good idea to cover the rotor in a thin layer of oil to reduce the risk of corrosion.

- Never use a claw puller or a hammer to disengage the rotor. Its magnets might become loose in the event. We offer a special puller for disengaging the new rotor again (see assembly instruction)!

- Should the motorcycle not be in use for some longer period, please disconnect the battery (so existing) to prevent current bleeding through the diodes of the regulator. Though, even a disconnected battery will empty itself after a while.

- Please do observe these remarks, but at the same time, don't be afraid of the installation process. Remember, that before you, thousands of other customers have successfully installed the system.

Enjoy driving your bike with its new electric heart!

Schaltplan 71ir6 (wiring diagram)
